 This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV34277) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 28 novel genes and their fragments (nucleic acid sequences. AAV4286-V43425, amino acid sequences AAV75196-W75235) which are useful for preventing, treating on an enclorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides. Specific uses are described for each of the 28 polymucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SSALSGTVVELRCQDKEGNPAPEYTWFKDGIRLLENPRIGSGSTNSSYTMNTKTGTLQFN 202

```
AAD44854-AAD44984 represent cDNAs corresponding to 28 human secreted
CC AAE27134 ASE27137 represent the proteins they encode.
AAE27138 AAE27134 represent human secreted protein fragments. The genes
and their corresponding secreted proteins are useful for preventing,
treating or ameliorating medical conditions, e.g., by protein or gene
therapy. Secreted protein sequences of the invention are useful for the
diagnosis or treatment of disorders auchimmune diseases (e.g.
thermatoid arbritis), hyperproliferative disorders (e.g. neoplasms of
the breast or liver), cerebrovascular disorders (e.g. cerebral ischaemia,
angiogenesis), cardiovascular disorders (e.g. cerebral ischaemia,
cc angiogenesis), cardiovascular disorders (e.g. cerebral ischaemia,
system disorders (e.g. Alzheimer's disease), infections caused by fungi,
bacteria and viruses and ocular disorders (e.g. corneal infection). The
polypeptides can also be used to aid wound healing and epithelial cell
cpolypeptides can also be used to aid wound healing and epithelial cell
cpolypeptides can also be used to aid wound healing and epithelial cell
cpolypeptides and in chemotaxis. They can also be used as food
additives or preservative to increase or decrease storage capabilities,
cf fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors
content, and other nutritional components. The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

```

```
The invention relates to an isolated polypeptide comprising an amino acid compressed at least 95% identical to sequence of 28 human secreted form, proteins, their fragment, polypeptide domain, epitope, secreted form, ariant, allelic variant, or psecies homologue, or the encoded sequence included in ATCC 97921 and 97922. Also included are the encoding mucleic acids, recombinant vectors, host cells, antibodies, and genes. The proteins and mucleic acids are useful for diagnosing, preventing, treating, prognosing or ameliorating a medical condition e.g. immunodeficiencies, severe combined immunodeficies, demarticis, cancers (e.g. seximan and allarey), gastroinnessie, chork disease, concertication seystem (CNS) disorders (e.g. septic shock, traumant chorse severe complications, inflammatory conders, lateral and cardiopulmonary company mylory, central nervous system (CNS) disorders (e.g. ischaese, AnDe-related disorders (e.g. gastric, ovarian, lung, bladder, liver and cardiopulmonary complement and sease, and cardiopulmonary complements of sease, and cardiopulmonary complements of seases, and cardiopulmonary complement disorders (e.g. demerticis, sarcoidosis, dermarticis, and prior disease, reparaticis, sarcoidosis, dermarticis, and prior disorders, renal disorders (e.g. demerticis, complement disorders (e.g. demerticis, complement disorders (e.g. dedmerticis), infectious disease, complement disorders (e.g. demertici
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human secreted polypeptides and polynucleotides for diagnosing, prognosing, preventing and treating immune, hyperproliferative, liver, kidney, reproductive disorders and for identifying modulators of therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                              Zeng Z, Kyaw H, Fischer CL, Li

ABZ71190-ABZ71478 represent CDNAs corresponding to 178 human secreted protein genes, and ABP00011-ABP00299 represent the proteins they encode. ABZ71479-ABZ71540 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, and recombinant to exercise and host cells comprising a nucleic acid of the invention. The secreted proteins in uncleic acids encoding them, antibodies or antibody fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, coesophagus, stomach, small intestine, large intestine, liver, biliary tract and pancreas, and include cancers of these organs and tissues. The cereted proteins and their nucleic acids may also be used in the creatment of immune disorders, inflammation, infection, chromosome companing, in gene therapy, for identifying individuals from minute markers. The present sequence represents a human secreted protein of the

The present sequence represents a secreted protein. The polynucleotide and secreted protein are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating activity, tissue growth activity, activin/inhibin activity, chemokinetic activity, haematopoiesis regulating chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, and thrombolytic activity, invasion suppressor, activity, and tumour inhibition activity (no data is

The sequence represents a human junctional adhesion molecule 2 (JAM2). The polynucleotide encoding the polypeptide is useful for recombinant production of JAM-2 protein, which in turn is useful for the production of antibodies. The antibodies may be used for probing cellular localisation and/or expression of JAM2 in tissues under normal and disease states, for immunoprecipitating JAM2 protein from cells and/or stroke tissues to determine whether it is modified by glycosylation and phosphorylation, and for determining JAM2 function. The antibodies inhibit interaction of JAM2 with inflammatory cells or influences their paracellular migration, and is therefore useful for alleviating inflammatory diseases such as arthritis, asthm, rheumatoid arthritis, inflammatory bowel disease and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acids encoding human junctional adhesion protein useful for producing antibodies that are suitable for therapeutic purposes

The invention relates to human secreted or transmembrane protein (I), their fragments and is encoded by specific complementary deoxyribonucleic caid (CDNA) inserts (II), where the protein is substantially free from acid comblements. (I) are useful for preventingly treatment or other mammalian proteins. (I) are useful for preventing, treatment or meallorating a medical condition, especially immunological treatment or prevention of tumours. (I) exhibits activity relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antiinflammatory, stem cell growth factor activity and activin or inhibin-related activities. (I) can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace colls damaged by illness, autoimmune disease, accidental damage or regeneration of nerve and brain tissue mid is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as altorial soll peripheral nervous system diseases and neuropathies, contact activity, regulation of haematopoiesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con treating osteoporosis, cartilage, tendon, ligament and/or nerve con lymphoid cell disorders, platelet disorders such as thrombocytopaenia con treating osteoporosis, cartilage, tendon, ligament and/or nerve con periodomial disease. (I) is also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperturiation in warious tissues, various immune deficiencies and disorders including autoimmune disorders e.g. multiple sclerosis, reperturiat

                                                                                                                                           The invention comprises the DNA and protein sequences of the extracellular region of human junctional adhesion molecules (huJAM). The extracellular huJAM DNA and protein sequences are useful in the treatment of: immune system disorders (e.g. immune deficiency); autoimmune disorders, inflammatory disorders, cancer; wound healing; or a cardiovascular disease. The present amino acid sequence represents the full-length membrane-bound huJAM2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               156
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               276
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         298

This introlled describes a movel PRO25 polypeptide (1), its agonist trom a carrier or excipient), a novel PRO25 polypeptide (1), its agonist or antagonist, or their fragments, for modulating; (i) infiltration of inflammatory calls into tissue; (ii) an immune response; or (iii) T cell proliferation. The composition increases or decreases any of the effects (i)-(iii). The products of the invention have anti-inflammatory, continuorismume and anti-diabetic activity. (i), and its (ant) agonists anti-autoimmune and anti-diabetic activity. (i), and its (ant) agonists and their fragments, are used to treat immune related diseases, particularly T cell-mediated diseases. The diseases treated include particularly T cell-mediated diseases. The diseases treated include created include architis, spondyloarthropathies, systemic sclerosis (scleroderma). Garbritis, spondyloarthropathies, systemic sclerosis (scleroderma), idiopathic inflammatory myopathies (dermatomyositis, putonimune chemistry and idiopathic immune pancytopenia (idiopathic thrombocytopenia (idiopathic thrombocytopenia), thyroiditis, atrophic cryptopathic inflammatory and interstitial nephritis), multiple sclerosis, cidiopathic demyelinating polymeuropathy, duillain-Barre syndrome, chronic chronic active hepatitis, primary biliary cirrhosis, granulomatous chronic active hepatitis, primary biliary cirrhosis, granulomatous chronic active hepatitis, primary biliary cirrhosis, granulomatous con whitned or inflammatory benefitie, inflammatory benefitie, and sclerosing cholmagitie, inflammatory bowel disease con whitned or inflammatory contines cronn's disease, and disease cronn's disease and disease cronn's each of memory and sclerosing chimics and sclerosing chimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              whipple's disease. Autoimmune or immune-mediated skin diseases including bullous skin diseases, erythema multiforme, contact dermatitis, psoriasis, asthma, allergic rhintis, atopic dermatitis, food hypersensitivity, urticaria, eosinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity pneumonitis, and transplantation associated diseases (graft rejection, and graft-versus-host-disease). (I), its (ant)agonists or fragment can also be used as adjuvant in treatment of tumors. Antibodies against (I) can also be used for diagnosing such diseases. This sequence represents the human PRO245 protein described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel composition containing (apart from a

The CDNA sequences are obtained from CDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.

The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and maintenance of gastrointestinal comecosa and the repair of acute and chronic mucosal lesions

C (e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal culceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous cell carcinoma of the vulva and gliomas), concers such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cell carcinoma of the used as corners such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cell carcinoma of the vulva and gliomas), corners such as lung squamous cells including Parkinson's disease, corners corners of the readment of growth or survival of nerve cells including Parkinson's disease, corners corner

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and anagonists are useful for treating and disgnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central and peripheral nervous systems, hepatobiliary diseases inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune emdiated skin diseases, allergic disease, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

AACSB37 to AACSB378 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AACSB37 to AACSB42 and AACSB42 and AAB33417 represent human PRO polymucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      156

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial angiogenic disorders in mammals (e.g. atherosclerosis, cancers and angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy. For example, the nucleic acids (NCB) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                US-09-852-797-76_COPY_23_298

    This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAV34277) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 28 novel genes and their fragments (nucleic acid sequences: AAV3426-V3435; amino acid sequences AAW75196-W75235) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the 28 polymucleotides. Specific uses are described for each of the 28 polymucleotides. Dased on which tissues they are most highly expressed in
                                                                                                                                                                                                      Isolated human poly:nucleotide(s) encoding secretory peptide(s) used to develop products for the diagnosis and treatment of e.g. inflammation, cancers, CNS disorders or immune system disorders
                                                                                                           Fischer CL, Gentz RL, Greene JM, Kyaw H;

AAE26983 RESULT

```
AAD44636-AAD44676 represent cDNAs corresponding to 28 human secreted protein genes, and AAE26959-AAE2699 represent the proteins they encode. AAE27000-AAE27025 represent human secreted protein fragments or their variants. The secreted proteins and genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Specific uses are described for each of the 28 genes, based on the tissues in which they are most highly expressed and include developing products for the diagnosis or treatment of immunodeficiencies, e.g., X-linked agammaglobulinaemia, B cell immunodeficiencies, severe or y. X-linked agammaglobulinaemia, multiple sclerosis, autoimmune erythematosus, rheumatoid arthritis, multiple sclerosis, autoimmune thyroiditis, autoimmune haemolytic anaemia, Goodpasture's syndrome, Grave's disease, diabetes mellitus, dermatitis, inflammatory conditions

AAD44954-AAD44984 represent cDNAs corresponding to 29 human secreted protein genes, and AAE27137 represent the proteins they encode. AAE27139-AAE27137 represent the proteins they encode. AAE27164 represent human secreted proteins tragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Secreted protein sequences of the invention are useful for the diagnosis or treatment of disorders such as autoimmune diseases (e.g. the matoid arthritis), hyperproliferative disorders (e.g. neoplasms of the breast or liver), cerebrovascular disorders (e.g. cerebral isofaemia, angiogenesis), cardiovascular disorders (e.g. cerebral isofaemia, polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs to regenerate tissues and in chemocravis. They concern transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemocravis. They can also be used as food additives or preservative to increase or decrease storage capabilities, and orther mitting protein, carbohydrate, vitamins, minerals, cofactors humans and orther mitting and encourants and orther angelia content, and any orthers. They can also be used as food and orther mitting and encourants and orther mitting and encourants and orther angelia content, and any orthers. They can also be abed as food and orther mitting and encourants and are accounted and orther angelia content, and any orthers. They can also be abed as food and orther and any orthers and any orthers and any orthers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            components. ```
The present invention relates to novel human secreted proteins

(ABR47633-ABR48145) and their coding sequences (ACC50344-ACC50856). The

proteins and their coding sequences are useful for the preparation of a

diagnostic or pharmaceutical composition for diagnosting or treating a

cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest,

cardiovascular disorders, muscular disorders, reproductive disorders,

immune system disorders, pulmonary disorders, reproductive disorders,

cardiovascular disorders, pulmonary disorders, reproductive disorders,

cy anstrointestinal disorders, pulmonary disorders, renal disorders,

proliferative disorders and/or cancerous disease and conditions, for

continual disorders and/or cancerous disease and conditions, for

infection, for treating thrombosis and arteriosclerosis, for treating or

continual damage which occurs in neuronal disorders or

neurodegenerative conditions such as Alzheimer's disease and Parkinson's

disease, to enhance bone and periodontal regeneration and aid in tissue

transplants or bone grafts, to prevent skin aging or hair loss, to

stimulate growth and differentiation of haematopoietic cells and bone

marrow cells when used in combination with other cytokines, to maintain

The invention relates to an isolated polypeptide comprising an amino acid sequence at least 95% identical to sequence of 28 human secreted form, proteins, their fragment, polypeptide domain, epitope, secreted form, cariant, allelic variant, polypeptide domain, epitope, secreted form, cariant, allelic variant, polypeptide domain, epitope, secreted form, cariant, allelic variant, polypeptide domain, extended in ATCC 97921 and 97822. Also included are the encoding cariant and proteins and nucleic acids are useful for diagnosing, preventing, creating pregnosing or ameliorating a medical condition e.g. treating prognosing or ameliorating amedical condition e.g. immunodeficiancies (e.g. X-linked agammaglobulinaemia, B cell immunodeficiancies) severe combined immunodeficiancies, multiple immunodeficiancies, severe combined immunodeficiancies, dermatitis, dermaticies, autoimmune thyroiditis, autoimmune hamolytic anaemia, conditions (e.g. systemic crythmatosyr conditions (e.g. septic shock, condessions), reperfusion injury, inflammatory conditions (e.g. septic shock, seppis, reperfusion injury, inflammatory conditions (e.g. septic shock, seppis, reperfusion injury, inflammatory conditions (e.g. septic shock, conditions), respiratory disorders (e.g. gasthma and allergy), gastrointestinal crythmatosyr conditions (e.g. septic shock, traumatic brain injury), neurodegenerative disorders (e.g. parkinson's disease and Alzheimer's disease, AlbS-related disorders (e.g. parkinson's disease and Alzheimer's disease, and cardoul ninyry and/or stroke, traumatic brain injury), neurodegenerative gancreaticis, arcidovascular disease, and cardoul cathersoclerosis, myocarditis, cardiovascular disease, and cardoul for stroke, traumatic pancreaticis, sarcoidosis, cardiovascular disease, and cardour cathersoclerosis, myocarditis, alloquic transplant rejection), hyperproliferative disorders (e.g. adue domentia, and prion disorders (e.g. adue domentia, and prion disorders (e.g. adue domentia, and pancreatic disorders (e.g. adue domentia, and p

Direction genes, and ABP00011-ABP00299 represent the proteins they encode.

Maz71479-ABZ77478 represent human secreted protein genomic fragments. The invention also encompasses antibodies specific for the secreted proteins, and recombinant the use of the secreted proteins in drug screening, and recombinant to vectors and host cells comprising a mucleic acid of the invention. The secreted proteins in mucleic acid of the invention. The secreted proteins, and included secreted proteins and host cells comprising a mucleic acid of the invention. The secreted proteins, and include disorders of protein activity are useful for diagnosing, treating, ameliorating or preventing digestive disorders. Such conditions include disorders of the mouth, cosophagus, stomach, small intestine, large intestine, liver, biliary tract and pancreas, and include cancers of these organs and tissues. The secreted proteins and their nucleic acids may also be used in the treatment of immune disorders, and to promote wound healing. Nucleic acids by Preproliferative disorders, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome cost the invention may be used for chromosome disorders, as hybridisation probes, and as molecular weight anxiets. The present sequence represents a human secreted protein of the

The present sequence represents a secreted protein. The polynucleotide and secreted protein are predicted to have biological activities which would make them suitable for treating, preventing or amaliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating activity, tissue succines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, chemotratic/chemokinetc activity, activin/inhibin activity, activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion auppressor activity, anti-inflammatory activity, cadherin/tumour juvasion auppressor activity, and tumour inhibition activity (no data is given in the specification to support these activities). The polynucleotide is also stated to be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SKLEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIKNVTRSDAGKYRCEVSAPSEOG 118

The polynucleotide encoding the polypeptide is useful for recombinant production of JAM-2 protein, which in turn is useful for the production of antibodies may be used for probing cellular localisation and/or expression of JAM2 in tissues under normal and disease states, for immunopracipitating JAM2 protein from cells and/or stroke tissues to determine whether it is modified by glycosylation and phosphorylation, and for determining JAM2 function. The antibodies inhibit interaction of JAM2 with inflammatory cells or influences their paracellular mignation, and is therefore useful for alleviating inflammatory diseases such as arthritis, asthma, rheumatoid arthritis, inflammatory bowel disease and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                    Novel nucleic acids encoding human junctional adhesion protein useful for producing antibodies that are suitable for therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents a human junctional adhesion molecule 2 (JAM2)

Novel secreted or transmembrane protein and polynucleotide encoding the protein, useful for diagnosis and treatment of neurological disorders, cancer, autoimmune diseases, bone disorders and lung or liver fibrosis Collins-Racie LA, LaVallie ER, Spaulding V; Treacy M, WPI; 2002-582343/62. N-PSDB; ABQ92017 Jacobs K, Merberg D,

Evans C;

McCoy

Claim 54; Page 116-117; 284pp; English.

The invention relates to human secreted or transmembrane protein (1), their fragments and is encoded by specific complementary deoxyribonucleic acid (cDNA) inserts (II), where the protein is substantially free from other mammalian proteins. (I) are useful for preventing, treating or ameliorating a medical condition, especially immunological treatment or prevention of tumours. (I) exhibits activity relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antiinflammatory, stem cell growth factor activity and activity no rinhibin-related activities. (I) can be used to manipulate stem cells in culture to give rise to neurospithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease, accidental damage or genetic disorders. (I) induces the proliferation of neural cells and cells damaged by illness, autoimmune disease, and rearment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Muntington's disease, amyotrophic central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Muntington's disease, amyotrophic activity, regulation of haematopolesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor lymphoid cell disorders, platelet disorders such as thrombocytopaenia cor treating osteoporosis, osteoarthrisis, bone degeneration or regeneration and treatment of lung or liver fibrosis, reperfusion injury cor regeneration and treatment of lung or liver fibrosis, reperfusion injury cor vergeneration and disorders or liver fibrosis, reperfusion injury con various immune disorders and disorders including autoimmune disorders e.g. multiple sclerosis, rheumatoid arthriss.

       immune deficiency or an inflammatory disorder, cancer, wound healing or a cardiovascular disease
                                                                                                             The invention comprises the DNA and protein sequences of the extracellular region of human junctional adhesion molecules (huJAM). extracellular huJAM DNA and protein sequences are useful in the tree of: immune system disorders (e.g. immune deficiency); autoimmune disorders; inflammatory disorders; cancer; wound healing; or a cardiovascular disease. The present amino acid sequence represents full-length membrane-bound huJAM2 protein.

diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as athma or other respiratory problems. (II) is useful to express recombinant protein, as markers for tissues in which the corresponding protein is preferentially expressed and in gene therapy. The present sequence is that of a polypeptide of the invention.

This invention describes a novel composition containing (apart from a carrier or excipient), a novel PRO245 polypeptide [1], its agonist or antagonist, or their fragments, for modulating: (i) infiltration of antagonist, or their fragments, for modulating: (i) infiltration of the effects of inflammatory cells into cissue; (ii) an immune response; or (iii) T cell proliferation. The composition increases or decreases any of the effects [1]-[iii]. The products of the invention have anti-inflammatory of the effects anti-autoimmune and anti-diabetic activity. (I), and its (ant) agonists and their fragments, are used to treat immune-related diseases.

Conticularly T cell-mediated diseases treated include systemic lupus erythematosus, rheumatoid arthritis, juvenile chronic arthritis, spondyloarthropathies (dermatomyositis, juvenile chronic arthritis, spondyloarthropathies (dermatomyositis, juvenile chronic arthritis, systemic vasculitis, sarcoidosis, autoimmune hemolytic anemia (immune pancytopenia, paroxysmal nocturnal hemolytic anemia (immune pancytopenia, paroxysmal nocturnal hemolytic anemia (immune pancytopenia, paroxysmal nocturnal chronic hemolytic anemia (immune pancytopenia, thyroiditis, artophic control of thyroiditis, juvenile lymphocytic thyroiditis, artophic control of thyroiditis, juvenile lymphocytic thyroiditis, artophic control of thyroiditis, juvenile lymphocytic thyroiditis, artophic dispathic demyelinating polyneuropathy, Guillan-Bare syndrome, chronic active hepatinas polyneuropathy, infectious hepatitis, indiametory demyelinating polyneuropathy, infectious hepatitis, demonic active hepatitis, pand solerosing cholangitis, inflammatory bowel disease including chronic active hepatitis, pand solerosing cholangitis, inflammatory bowel disease including chronic active hepatitis, pand solerosing cholangitis, inflammatory bowel disease including curicaria eosinophilic proteinne mediated for dispancia enteropathy, and transplantation associated diseases confragence and solerosing and dispance and addivent

The specification describes A33 related antigens PRO301, PRO362 and PRO245. The methods and compositions of the invention are useful for the PRO245. The methods and compositions of the invention are useful for the C reatment and diagnosis of inflammatory disease and tumours in mammals. Such inflammatory diseases include of inflammatory bowel disease, c Such inflammatory diseases include of inflammatory bowel disease, c Such inflammatory wypathies, systemic scherosis, solvenile chronic arthritis, spondyloarthropathies, systemic scherosis, polymyositis, cidiopathic inflammatory myopathies, dermatomyositis, polymyositis, comman, immune pancytopenia, paroxysmal nocturnal hemoglobinuria, anemia, immune pancytopenia, idiopathic thrombocytopenic purpura, immune pancytopenia, idiopathic thrombocytopenic purpura, immune mediated thrombocytopenia, thyroiditis, Grave's disease, immune-mediated disease, c Hashimoto's thyroiditis, juvenile lymphocytic thyroiditis, atrophic thyroiditis, dabetes mealitus, immune-mediated meal disease, infectious hepatitis cof the central and peripheral nervous systems such as multiple sclerosis, cidiopathic polymeuropathy, hepatobiliary diseases, infectious hepatitis cof hepatitis, primary biliary cirrhosis, granulomatous hepatitis, sclerosing cof cholangitis, inflammatory and fibrotic lung diseases, gluten-sensitive enteropathy, Whipple's diseases altomatous hepathic pulmonary fibrosis and hypersensitivity pneumonitis cransplantation associated diseases disease. The present sequence cor ransplantation associated diseases disease. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       97 QNLEEDTVTLEVLVAPAVPSCEVPSSALSGTVVELRCQDKEGNPAPEYTWFKDGIRLLEN 156

```
AAY13344-403 represent secreted and transmembrane human proteins.

The CDNA sequences are obtained from CDNA libraries, prepared from

CC fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina.

CT he encoded polypeptides have specific uses based on their homology to

Known polypeptides, e.g. PRO211 and PRO217 can be used for disorders

CC sasociated with the preservation and maintenance of gastrointestinal

CC ucatated with the preservation and maintenance of gastrointestinal

CC ucatation and congenital microvillus strophy), skin diseases associated

With abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CC ucatation and congenital microvillus arrophy), skin diseases associated

With abnormal keratinocyte differentiation (e.g. psoriasis, epithelial

CC ptent effects on cell growth and development, diseases related to

CC profit fibromodulin, e.g. for reducing derand scarring. PRO266 can be used as

CC Alzheimer's disease, ALS, neuropathies or cancer. PRO265 can be used as

CC for fibromodulin, e.g. for reducing derand secarring. PRO264 can be used

CC USHER Syndrome or Atrophia areata; PRO333 may be used in the treatment

CC USHER Syndrome or Atrophia areata; PRO353 may be used as an

CC anti-thrombotic agent; PRO387 polypeptides and portions may have

CC therapeutic applications in wound healing and tissue repair; PRO317 can

CC be used for treating problems of the kidney, uterus, endometrium, blood

CC vessels, or related tissue, e.g. in the heart of genital tract.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     97 QNLEEDTVTLEVLVAPAVPSCEVPSSALSGTVVELRCQDKEGNPAPEYTWFKDGIRLLEN 156

(GETH) GENENTECH INC

```
The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO anti-PRO antibodies, agonists and antagonists are useful for treating and disgnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of the central and peripheral nervous systems, hepatobiliary diseases inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune-mediated skin diseases allergic diseases, immunological diseases of the lung, and transphantation associated diseases including graft rejection and graft-versus-host-disease. AACS8519 to AACS8518 represent PKP primers and hybridisation probes used in the isolation of human PRO sequences. AACS8579 to AACS8642 and AACS8642 and AAB33477 represent human PRO polymuclectide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         59 SRLEWKKLGRSVSFVYYQQTLQGDFKNRAEMIDFNIRIRNVTRSDAGKYRCEVSAPSEQG 118

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endochelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endochelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors ansociated with decreased PRO expression. AAA77510 to AAA77721 and AAB2438 to AAB2438 to ABA2435 represent nucleotide and protein sequences used in the example of the argument of the encoders.
